Creating an instance You can create an instance from the project file by pressing the **Create** button. An instance can be created in various ways, for example by using the **Save As** or **Copy from File** buttons. The **Save As** button will save the instance to the current folder and you can then change the name. The **Copy from File** button will copy the instance to the current folder. Press the **Close** button to close the instance. Open the **Project** tab to open the project file. Open the **Options** tab and then press **Save**. An instance can also be created from scratch by clicking the **New** button. You can change the instance properties by opening the instance properties tab and then pressing the **Set** button. Close the file. You can now use the instances on your PCB board. ## Using the instance

#### What's New in the AutoCAD?

Markup Assist Available on iPad: No more frustration and time spent rekeying. Use hands-free drawing and mark-up with automatic rekeying. Dynamics: New! Layer and Shape Builder with Dynamic Placement and Placement Manager When you're drawing on a flat 2D surface, you don't need to worry about placing the various objects on the flat surface. But when you're designing the interior of a three-dimensional space or creating a box, it's important that you're aware of how the various objects are going to interact and where the edges of the objects will connect. When you're designing a box, for example, you'll need to put the box's edges on the box's surfaces, and the box's corners on the box's surfaces. That's the reason why the current Layer and Shape Builder enables you to create each edge and corner of the box with a specific edge shape or corner shape. To do that, you have to manually select every edge or corner on the box. Using the new Dynamic Placement feature, you can add a box-edge edge at any point along the edge of the box with just a couple of taps on the screen. Once you add the edge, the dynamic placement manager automatically places the edge on every part of the box that's affected by the edge. The Dynamic Placement Manager is also helpful for placing shapes and elements. You can add any shape or element at any point on a drawing by just dragging the shape or element to any point on the surface. You can do this with multiple shapes or elements at the same time, too. Create boxes with any shape and size You can easily create boxes with any shape, size, or style. You don't need to create the corner shapes or complete the box's edges before creating the box. The default box is square. You can change its shape to any other type, and the Dynamic Placement Manager will place the edge at any point along the box's surface. The Dynamic Placement Manager also does a great job of placing the box corners. (video: 1:
