* **Tools**. In this category, you'll find all the basic image manipulation tools: cloning, healing, masking, reworking, and text. * **Batch**. Files containing layers are referred to as _batch files_. With this tool, you can process a bunch of them at once. * **Filters**. Plug-ins that add special effects to your images. You can install them from the Adobe website. * **Layers**. Layers let you edit an image and apply the changes to a second, copyable image. * **Photomerge**. This tool allows you to take multiple images and combine them into one seamless image. * **RGB color**. Photoshop's default color scheme is the YCC color model, which is the most common and which is what you should assume when you're working with color in Photoshop. But there is another model for RGB color that goes by the same name. Sometimes you'll see it referred to as YCbCr, the way color is understood by the device that displays an image. * **Channel**. This tool lets you split the pixels of the red, green, or blue (RGB) components of an image (see the "Adjusting Levels" box on the previous page). In the Layers panel, this feature creates a color channel that you can use to alter any layer, one layer at a time, the way you would with a color adjustment. In other words, you can create a new layer that's Red, then a new layer that's Green, and so on. * **Color**. This tool is for picking a color and working with it. * **Composite**. This tool allows you to combine images together, layer by layer, just as you can with the Layers panel. * **Faster**. This tool makes certain commands and options available when you're working quickly. * **Export**. This tool opens a dialog box from which you can choose a file destination. You can save a PSD or a JPEG file, or you can share your image via PDF, SVG, or TXT. Photoshop supports 15 different file format types. You can save your files in any of these formats, and you can open any of them in Photoshop.

Ask HN: What distinguishes a web.py framework from a WSGI framework? - rbanffy For example, www.roozbeh.info is a web.py app. It also comes with a module called quora_relay; the documentation (states that it's WSGI compatible, but I cannot find any information that actually proves that it is. They do point to an application server (dubbo.apache) which I do not understand. ===== spatular Mostly because it is just like WSGI, in the sense that it is just a wrapper around FastCGI. It basically turns your Python script into a regular CGI one. The main difference is that web.py provides the management of sessions, which WSGI doesn't. If you need sessions, why not take a look at Django? ~~~ spatular Besides WSGI is an generic framework, meaning it has nothing to do with web.py ----- jamesbritt Web.py is just an API to process requests. In practical terms, that means it allows you to do something like this: """ @add.post(path="questions/new", data="question: "Hello world!", json=True) def response(request, question_id=None): """ If there was a question with question_id = 0 on the server, then we return it. Otherwise, we first cache the question. """ question = web.session.get(key="questions:") if not question: question = web.response.json(request, 200, question_id=0, question="{ }") return web.response.json(request, 200, question_id=question_id, question=question) """ @main.route(path="/") def home(): questions = [{ "question": "What is your favorite programming language?", "id": 0 }, { "question": "What is your favorite food?", "id": 1 }, { "question": "What is your favorite book?", "id": 2 }, { "question": "What is your favorite country?", "id": 3 }, { "question": "What is your favorite quote?", "id": 4 }
