run on all modern versions of macOS, Windows and Linux. You will need a working internet connection to get the most out of Adobe Photoshop Elements. Older editions of Photoshop (e.g. Photoshop CS3) are not compatible with Adobe Photoshop Elements. Installing Adobe Photoshop Elements on macOS You will need to download Adobe Photoshop Elements 2020 for macOS. The installation process is very simple, a simple click and wait process. Once the installer has finished, follow the onscreen instructions to create a Photoshop Elements account and log in. You will be asked if you want to use your existing Photographic Elements account, or create a new one. The new account is free of charge, but you need to enter your email address and a password to create the account. Don't forget to store your password securely, in a safe place. Editing images Image editing in Adobe Photoshop Elements is easy. There are a number of controls that can be used to manipulate and enhance the image in various ways. The dialog boxes can be more easily used than the main window. Aligning and rotating images To work with images on a sheet, set them to fit the active window, and then select the Align and Rotate tool from the toolbox. This tool can be very useful for aligning images and applying portrait and landscape orientation. When editing a photo, you may want to use the crop tool to select a rectangular area of the image to crop off the edge. The crop tool automatically selects the right orientation. Other useful tools are the grid and the straight tool. The grid tool displays a grid over the image, which you can use to align images. To select a specific spot on the grid, drag it over the image. To align an image on a selected spot on the grid, double-click the grid. When the image is positioned perfectly over the grid, the automatic crop tool will select the right part of the image to remove. The straight tool can be used to align and rotate an image. You can use it by selecting the right tool in the toolbox, clicking on the image, dragging the mouse, or key Command-A to select the whole image, and then rotate the mouse and drag to the left or right to rotate the image clockwise or counter-clockwise. The use of stereoscopic surgical video systems for assisting a surgeon in performing a surgical procedure has become commonplace, particularly in endoscopic surgical procedures. In an endoscopic surgical procedure, access to the surgical site is limited to a relatively small, generally tubular opening, such as a cannula or trocar tube, through which the surgeon is required to perform the surgical procedure. The stereoscopic video systems commonly used in surgical procedures are based upon the principle of stereopsis, or the perception of depth and distance by the brain. When one views stereoscopic images, the brain is capable of receiving two separate images or cues, each image being presented to the left or the right eye of the viewer. Each eye thus receives a slightly different perspective or picture of the subject, thereby forming in the brain a perception of depth. In addition, each eye is provided with a different perspective of the distance to the objects and people in the image. The observer thus receives a three-dimensional view of a subject which permits the observer to retain a memory of depth, distance, and texture. The stereoscopic video systems used in endoscopic surgical procedures are typically two dimensional planar devices capable of storing two dimensional video frames. In other words, the systems are not capable of displaying a three-dimensional image. Therefore, in a typical stereo surgical video system, an image of a surgical site is captured by a video camera. The video signal, which represents the image captured by the video camera, is then electronically processed by a video processor. The processed video signal is then input into a display, which outputs a two-dimensional screen image. The screen image is then viewed by the surgeon using the stereoscopic video system in order to view stereoscopic images of the surgical site. The two-dimensional screen image may be a flat image, such as a light field image, a side-by-side image, or a top-bottom image. The processing of the video signal by the video processor may vary, depending upon the particular video processor. For example, the video processor may compare video frame pixels with predetermined reference frames and, based upon a predetermined function of the comparison, synthesize or otherwise alter the video signal to enhance the video. In order to view a three-dimensional, stereoscopic view of the surgical site, a surgeon must wear polarizing glasses, which alternately block the left and right eye of the viewer. The stereoscopic video system is arranged to present each eye with a video view of the surgical site. Each eye, therefore, will receive
